LinkedIn tableside.pk valar.digital Portfolio

PROFILE

AI-forward startup founder and software engineer with 6 years of experience shipping products across AI SaaS, Roblox, VR and mobile. Founder and CEO of TableSide, which launched Asia's first AR menus using an automated photo-to-3D pipeline. Founder of Valar, an AI traffic firewall that detects, redacts and blocks sensitive data before it reaches LLM providers. Background in game development with Lua, Unity, Unreal Engine and Roblox Studio, including work on titles with 400k+ daily active users. Hands-on with fine-tuning, evaluating and serving open-weight LLMs on an NVIDIA DGX Spark, and building agentic AI workflows. Strong in product strategy, performance optimization, remote team coordination and taking products from idea to launch.

EXPERIENCE

TABLESIDE, FOUNDER AND CEO

Jul 2026 to present Karachi, Pakistan tableside.pk

- Lead company strategy, product and growth for a SaaS that turns phone photos of dishes into 3D models for AR menus and marketing banners, with a fully automated pipeline of about 10 minutes per dish and no manual input.
- Launched Asia's first AR menus with 5+ restaurant brands: 130+ dishes modelled and 4,000 diner scans in 4 weeks.
- Architected for low marginal cost (Cloudflare R2/CDN, Fly.io, Supabase, Vercel) at under $20 per menu per month.
- Shipped contactless ordering with POS integration and a review system with priority-based alerting.

VALAR, FOUNDER

Apr 2026 to present Karachi, Pakistan valar.digital

- Building an AI traffic firewall: an OpenAI-compatible gateway that sits between a company's employees, apps and agents and LLM providers (OpenAI, Anthropic, Azure, Google), with no app rewrites required.
- Detects sensitive customer data, personal information, secrets (API keys, tokens, database URLs) and prompt-injection attacks in English, Urdu and Roman Urdu in real time.
- Enforces policy actions (observe, alert, redact, block or require approval) and keeps metadata-only audit logs, so compliance gets evidence without storing raw prompts.
- Offers Pakistan-grade DLP (e.g. CNIC detection), self-hosted or SaaS deployment, on-prem LLM support and an executive risk dashboard; sold through a 7-day risk-audit pilot to fintech, BPO, healthcare, legal and software teams.

VOLDEX, SOFTWARE ENGINEER

Feb 2025 to Apr 2026 Remote

- Developed and maintained Roblox experiences in Lua and Roblox Studio for a large, active player base.
- Implemented performance optimizations that reduced memory usage and improved gameplay responsiveness.
- Introduced monetization features that increased player engagement and revenue.
- Coordinated with designers and artists via Discord and Monday to ship features on schedule.
- Streamlined Git version-control workflows to improve team collaboration and code stability.

REMIO VR, UNITY DEVELOPER

Nov 2020 to Feb 2025 Remote

- Built large-scale VR environments in Unity for titles including BeastCraft, AnimalBlocks and Remio, supporting 100k+ monthly active users.
- Cut loading times by 25% through code refactoring and resource optimization.
- Integrated Blender assets and advanced physics systems to create immersive VR experiences.
- Shipped monthly patches and new features to sustain player retention.
- Collaborated across time zones using Jira and Linear for sprint planning and on-time delivery.

AI ENGINEERING

LOCAL LLM LAB, NVIDIA DGX SPARK

2025 to present Karachi, Pakistan

- Run a personal AI lab on an NVIDIA DGX Spark (Grace Blackwell, 128 GB unified memory) for fine-tuning, evaluating and serving open-weight LLMs locally.
- Fine-tune open-weight models with LoRA and QLoRA supervised fine-tuning using PyTorch and Hugging Face (Transformers, PEFT, TRL), including dataset curation, cleaning and formatting.
- Build evaluation sets to compare base and fine-tuned models on task accuracy, latency and cost before deploying.
- Quantize and serve models for low-latency local inference, the same setup that backs Valar's on-prem LLM option for clients who cannot send data to external providers.
- Design agentic AI workflows that chain LLM calls, tool use and retrieval (RAG) to automate multi-step tasks.

PROJECTS AND ACHIEVEMENTS

- Worked on NFL Football Universe on Roblox, a game with over 400k daily active users.
- Published 15+ VR experiences to the Meta Store and two mobile games to Google Play, including Kingdom Jump.
- Placed 3rd for Collaborative Games Development and 5th for Game Programming at the GVE showcase.
- Worked in multi-disciplinary teams of up to 19 people on The Bloodening (wave survival) and Rabid Racers (kart racing).

EDUCATION

STAFFORDSHIRE UNIVERSITY

BSc (Hons) Games Design & Programming

- Second Class Honours. Graduated June 2020

SKILLS

AI AND LLM	LLM fine-tuning (LoRA, QLoRA, SFT), PyTorch, Hugging Face (Transformers, PEFT, TRL), model evaluation, quantization, local/on-prem inference, NVIDIA DGX Spark, RAG, agentic workflows and tool use, LLM APIs (OpenAI, Anthropic), AI gateways, PII redaction and DLP, prompt-injection detection, AI guardrails, prompt engineering, photo-to-3D pipelines
PRODUCT	Product strategy, roadmap ownership, go-to-market, pilot sales, stakeholder management, remote team coordination, Agile/Scrum
GAME DEVELOPMENT	Unity, Unreal Engine, Roblox Studio, VR/XR (Meta Quest), AR, physics systems, monetization design, performance optimization
PROGRAMMING	Lua/Luau, C#, C++, JavaScript/TypeScript, Python
CLOUD	Cloudflare R2/CDN, Fly.io, Supabase, Vercel, POS integrations
TOOLS	Git, Jira, Linear, Monday, Discord, Blender
